TO: St. Johnsbury WWTF file (site #90-0536)

THROUGH: George Desch, Chief, Sites Management Section *CS for*  
Chuck Schwer, Supervisor, Sites Management Section *CS*

FROM: Richard F. Spiese, Sites Coordinator *RFS*  
Sites Management Section

DATE: January 3, 1994

SUBJECT: Closure of Site

-----

One 3,000 gallon #2 fuel UST was removed from the St. Johnsbury WWTF on May 10, 1990. The tank pull was overseen by Pat Coyne, who filled out the Tank Pull Form. The form states that the only receptor impacted at the site was soils, that the soil type is clay, that 10 cubic yards of soils were stockpiled at the site, and that soils were impacted at 10-15 ppm by PID. This form, and the VSPS score, are the only documents in the file.

Due to the time since the last correspondence, the amount and type of contamination present, and the low VSPS score (site assessment calculated score of 11 with a CI of 49), I recommend that this site be NFAPed (or SMACed). The SMS could try and find out where the 10 cubic yards of soils ultimately ended up, but I believe that due to the time that has passed, the small amount of soil (approximately 10 cubic yards), and the fact that these soils were stockpiled on site, it is reasonable to assume that these soils were thinspread on site.

If you concur with my recommendation to NFAP this site, please initial and return this memo to me. I will then take the appropriate steps to see that the site is removed from the active sites list. *This will include notification of this decision to the town.*
